MediaLens
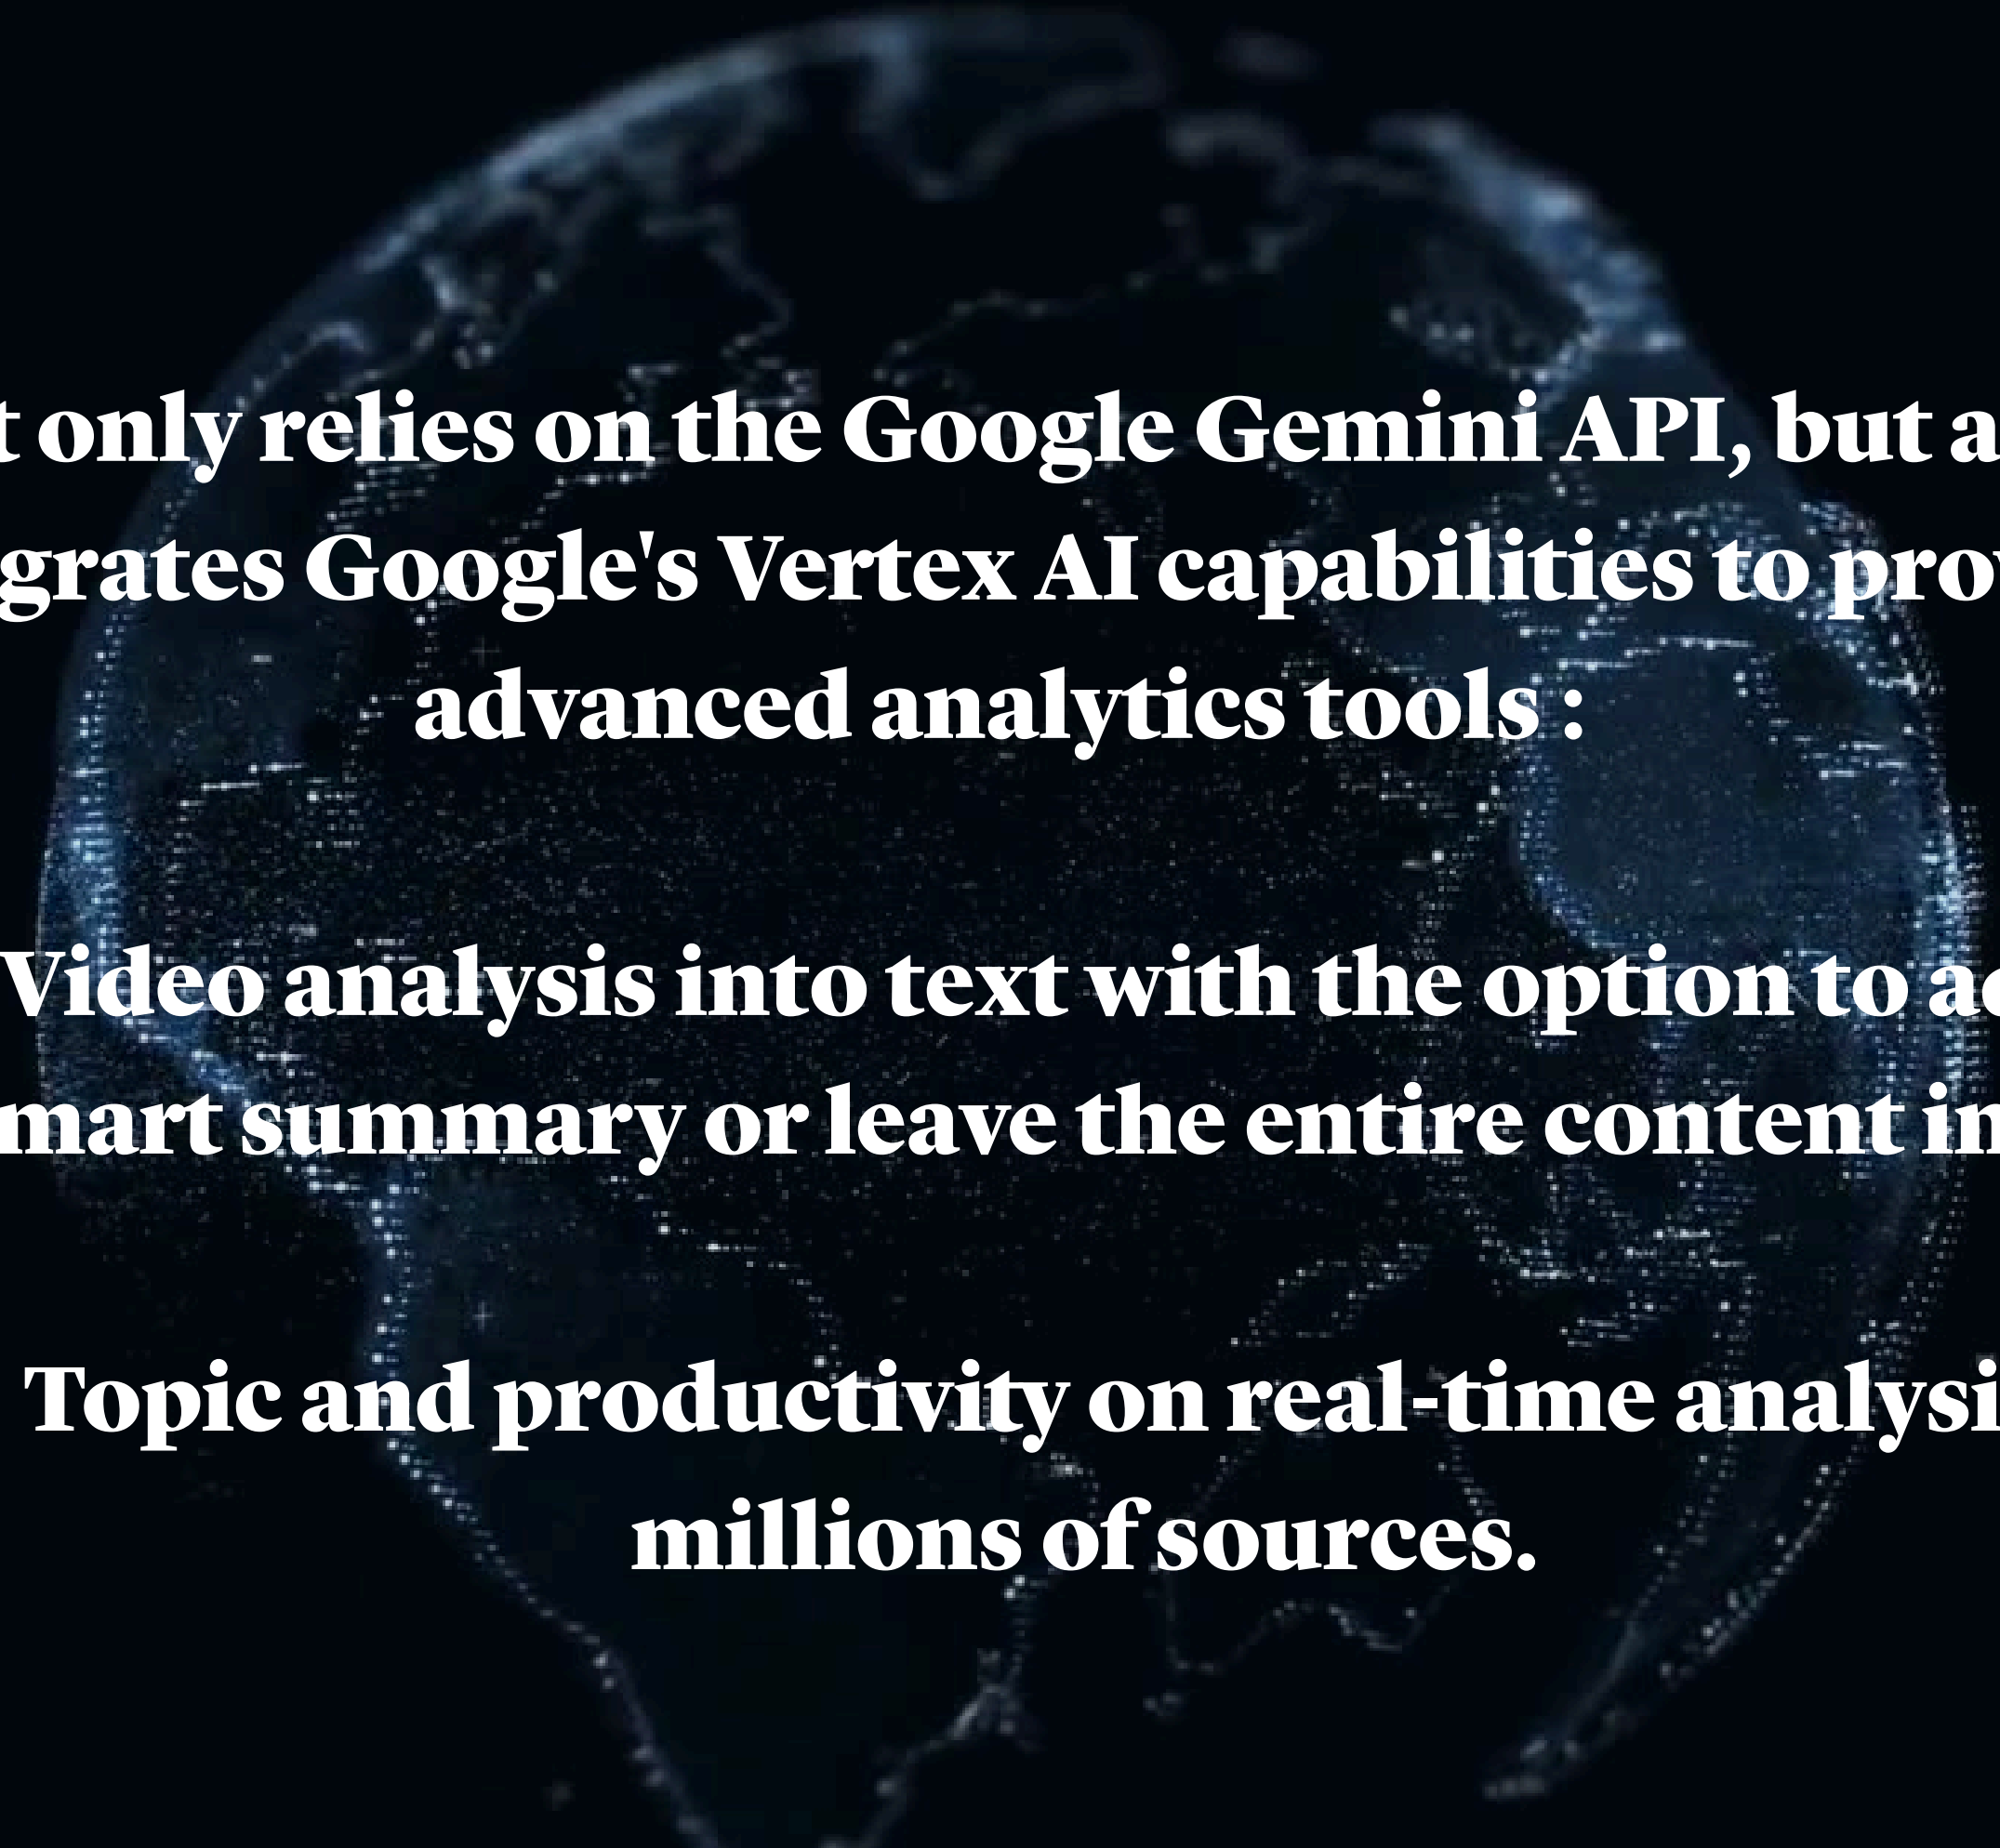

An innovative AI-powered media project developed
by a team of software engineers systems.

The platform is a flexible, web application
designed with software architectures and design
patterns that ensure maintainability, scalability,
and smooth future enhancements.

not only relies on the Google Gemini API, but also integrates Google's Vertex AI capabilities to provide advanced analytics tools :

- Video analysis into text with the option to add a smart summary or leave the entire content intact.

- Topic and productivity on real-time analysis of millions of sources.

Asking questions like, "What are the most important social issues today?" allows AI to provide accurate summaries and practical recommendations that can easily be transformed into actionable, productive ideas.

THANK YOU
